Truss. The method of joints uses the summation of forces at a joint to solve the force in the members. It does not use the moment equilibrium equation to solve the problem. In a two dimensional set of equations, In three dimensions, $\sum F_x = 0$, $\sum F_y = 0$, $\sum F_z = 0$

On a truss problem, it is often helpful to write in values as you solve for them. I have done so above. With AB and AC known, let's look at joint B. Sense of unknown forces is assumed. (You may either make a guess based on intuition, or a perfectly arbitrary assumption.)

If a truss is in equilibrium, then each of its joints must be in equilibrium. The method of joints consists of satisfying the equilibrium equations for forces acting on each joint. $\sum F_x = 0$ $\sum F_y = 0$ Method of Joints Recall, that the line of action of a force acting on a joint is determined by the geometry of the truss member.
